**North Central Forest Experiment Station  
Forest Service—U.S. Department of Agriculture  
1992 Folwell Avenue  
St. Paul, Minnesota 55108  
Manuscript approved for publication July 10, 1995  
1995**

This report includes the most commonly used Forest Inventory and Analysis statistics. Additional forest resource data can be provided. Persons requesting additional information from the raw inventory data are expected to pay the retrieval costs. These costs range from less than \$100 for a relatively simple request to \$2,000 for a complex retrieval involving the services of a Forest Inventory and Analysis computer programmer. Requests will be filled so as to minimize the impact on the Forest Inventory and Analysis Work Unit.

Requests for information may be directed to:

## FOREWORD

Since the original *Minnesota Forest Statistics, 1990*, Resource Bulletin NC-141, was published in 1992, a number of errors have been noted that affect the published results. The number of affected tables and the amount of change needed to published figures were considered to be sufficient to warrant publishing a corrected resource bulletin, rather than issuing an errata sheet. These changes reduced the reported area of timberland by 0.3 percent, increased the volume of growing stock by 0.3 percent, and increased growing-stock average annual growth by 0.5 percent. We regret any inconvenience this may have caused.

The fifth inventory of Minnesota was directed by Neal P. Kingsley, Forest Inventory and Analysis (FIA) program manager. David F. Heinzen, supervisor for the Minnesota Department of Natural Resource's (DNR) Resource Assessment Analysis Program, was responsible for overseeing DNR personnel and contract field crews. Jerold T. Hahn and Mark H. Hansen were responsible for inventory design. Arnold (Jerry) Ostrom supervised the FIA field crews, which were responsible for collecting field data in the Central Hardwood and Prairie Units and in part of Itasca County. Steve Flackey of the Minnesota DNR supervised the field crews that collected data in the Aspen-Birch and Northern Pine Units. Elizabeth C. Collins supervised FIA's photo interpretation staff, while George Deegan of the Minnesota DNR was responsible for supervising State photo interpreters.

### FIA field crew members:

Nancy Ady, Karen Brand, Becky Bryan, John Bryan, Michael Burns, Paul Castillo, Mark Dilley, John DuPlissis, Loren Eide, Jay Flynn, Mark Hamel, Cheri Hartless, Patrick Hartless, Robert Haukereid, Douglas Hecker, Glenda Hefty, Gary Inhelder, Peter Koehler, Gary Larson, William Nelson, William Peters, Ron Piva, Lois Poppert, Loren Poppert, Ed Rumbold, Nicholas Severson, Jerry Van Cleve, Linda Weidel, Dan Wendt

### FIA field crew clerk typist: Monica Van Cleve

### Minnesota DNR field crew members:

Ben Anderson, Dana Carlson, Johnathon Carter, Marty Cassellius, Gary Cummings, John Dowd, Steve Flackey, Steve Gallay, Harley Hanson, Mark Holien, Bob Heisel, Bill Julson, Edward Koski, Peter Lindemanis, Larry Long, Rob Maki, Dave Marshall, Doug Miedtke, Albert Mitchell, Ralph Niemi, Terry Novak, Dick Peterson, Greg Russell, Randy Schindle, Bruce Schoenenberg, Jeff Sirjod, Bill Schuster, Scott Seeley, Craig Sterle, Greg Vollahaber

### Minnesota DNR field crew clerk typist: Peggy Nelson

### Contracting field crew members:

Sue Abrahamson, Brian Allen, John Allen, Howard Arch, Dave Arends, Barbara Knight, David Banta, Rick Barber, Rick Barta, Michael Baumer, Duran Bjorklund, Carl Brummard, Tom Buescher, Scott Bunney, Scott Burns, John Calgaro, Mark Carter, Bob Cavallaro, Pat Churack, Joe Clark, Richard Cooper, Jim Enblom, Tom Erickson, Rob Eul, Tim Eul, Jay Flynn, Jeff Fossen, Joel Fyock, Bill Giblin, John Gray, Stan Grossman, Bill Hamm, Don Hoppe, Scott Horton, Ken Jaeger, Dale Johnson, Rosemary Johnson, Michael Lea, Greg Lenz, Robert Hurray, Bill Loscheider, Mike Kaiser, Bob Kari, David Kasper, Joe McDonald, Craig Maly, Ronald Meyer, John Miller, George Niskala, Dan Peterson, Phil Polzer, Michael Rath, Stan Ricker, Ron Rombach, Karen Ruder, Don Small, John Schaff, Nick Severson, Michael Steinfeldt, Kevin Sturgesleski, Jan Tennant, Patricia Topley, Dan Wendt, Bill Wilson

Training provided by Minnesota DNR disease and insect specialists increased the accuracy of tree class determination. These classifications now more accurately reflect the utilization of aspen and several other species. Training of field crews was done by Michael Albers, Jana Albers, and Ed Hayes. Tom Eiber and Alan Jones were responsible for the development of standardized disease and damage codes. Olin Phillips, Cooperative Forest Management Supervisor, established the cooperative framework.

FIA photo interpreters:

Rose Berg, Elizabeth Collins, Julie Fleming, Dale Gormanson, Mark Johnson, Barb Knight, Leo Larkin, Jay Solomakos, Mark Springen

Minnesota DNR photo interpreters:

Marty Casselius, George Deegan, John Falkner, Steve Flackey, Valiree Hanson, Craig Mellin, Greg Russell, Scott Seeley

Patrick D. Miles and Mark H. Hansen were responsible for generating area, volume, growth, and removals tables. William (Brad) Smith and Ronald L. Hackett collected and compiled data on timber product outputs and timber removals. Pat Murray and Jay Solomakos edited the data.

Mary Jean Hanson and Daniel S. Goodman provided administrative and secretarial support. Computer support was provided by Gerhard K. Raile.

Forest Inventory and Analysis (FIA) is a continuing endeavor as mandated by the Renewable Resources Research Act of 1978. Prior inventories were mandated by the McSweeney-McNary Forest Research Act of 1928. The objective of FIA is to periodically inventory the Nation's forest land to determine its extent, condition, volume of timber, growth, and removals. Up-to-date resource information is essential to frame forest policies and programs. USDA Forest Service regional experiment stations are responsible for conducting these inventories and publishing summary reports for individual States. The North Central Forest Experiment Station is responsible for forest inventory and analysis in Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Wisconsin.

Fieldwork for the fifth Minnesota forest inventory was begun in April 1986 and completed in February 1991. Reports of four previous inventories of Minnesota's timber resource are dated 1936, 1953, 1962, and 1977.

More accurate survey information was obtained during this survey than otherwise would have been feasible because of intensified field sampling. Such sampling was made possible through the cooperation and assistance of the Minnesota DNR. Data for the Aspen-Birch and Northern Pine Units were collected by contract crews hired and supervised by the Minnesota DNR. The DNR installed several hundred additional plots on national forest land. These efforts increased the sampling intensity on national forest lands from a single intensity level to the triple intensity level that is typical of the rest of the State. Data for the Central Hardwood and Prairie Units were collected by FIA staff. To aid in determining current timber removals, the Minnesota DNR also surveyed primary wood-using plants in the State.

Aerial photos used in the forest inventory were purchased by the State from the U.S. Geological Survey. This photography was from the National High Altitude Photography program (NHAP). In addition, the Minnesota DNR provided 35mm true color prints at a scale of 1:15,840 of all of the 1977 plot locations to enable disturbance detection.

# Minnesota Forest Statistics, 1990, Revised

Patrick D. Miles, Chung M. Chen, and Earl C. Leatherberry

## HIGHLIGHTS

**NOTE:** *Data from new forest inventories are often compared with data from earlier inventories to determine trends in forest resources. However, for the comparisons to be valid, the procedures used in the two inventories must be similar. As a result of our ongoing efforts to improve the efficiency and reliability of the inventory, several changes in procedures and definitions have occurred since the last Minnesota inventory in 1977. Because some of these changes will make it inappropriate to directly compare the 1990 data with those published for 1977, data from the 1977 inventory have been reprocessed using the 1990 procedures. Please refer to the section labeled "Comparing Minnesota's Fifth Inventory With the Fourth Inventory" for more details.*

## General

Minnesota is divided into four survey units (fig. 1), and separate statistical reports have been published for each unit. Unit boundaries roughly align with the three broad ecoregions in Minnesota. The Aspen-Birch and Northern Pine Survey Units in the north contain most of the State's boreal forest. The Central Hardwoods Survey Unit in the southeast is dominated by

---

**Patrick D. Miles**, Forester, received a bachelor's degree in forestry in 1981 and a master's degree in forest economics in 1984 from the University of Minnesota. He joined the Forest Service in 1984 and has been with the Forest Inventory and Analysis Unit since 1989.

**Chung M. Chen**, Senior Research Analyst for the Minnesota DNR, received a bachelor's degree in forestry from Taiwan National Chung-sing University, a master's degree from Yale, and a Ph.D. from the University of Minnesota.

**Earl C. Leatherberry**, Resource Analyst, received a bachelor's degree in geography from North Carolina Central University and a master's degree in geography from the University of Michigan. He joined the Forest Service in 1973, and has been with the Forest Inventory and Analysis Unit since 1985.

hardwoods. And the Prairie Survey Unit in the west, once open prairie, is now nearly 85 percent cropland.

The geology and soils of the northern two-thirds of the State are largely the result of glaciation. The flat area in the northwest corner of the State was once the basin of ancient Lake Agassiz. Bare bedrock and shallow soils in the northeast show the scars left by advancing and retreating glaciers. The sandy gravelly soils of parts of central Minnesota, along with potholes, drumlins, and moraines, are additional evidence of these recent geologic events. Southeastern Minnesota, largely untouched by glaciation, has a much older landscape. The valleys and bluffs in the southeast have been etched out over a much longer time period. Rivers, periodically filled to overflowing by glacial runoff, have carved valleys and bluffs from sedimentary layers deposited in ancient seas.

## Forest Area

- The total land area of Minnesota is 50.9 million acres, of which 33 percent is forested. The area of all forest land in the State has increased by 0.7 percent since 1977 to 16.7 million acres. The current forest area includes 1.1 million acres of reserved forest land where harvesting is prohibited by statute or administrative designation. The largest area of reserved forest land (1.0 million acres) is in the Aspen-Birch Survey Unit, primarily the Boundary Waters Canoe Area Wilderness and Voyageurs National Park.
- There were 14,723,200 acres of timberland in the State in 1990, an 8.2 percent increase from 1977. Just over half of this increase resulted from the reclassification of unproductive forest land to timberland in 1990. Sample plots with a low site index (under 15 for northern white-cedar, 20 for black spruce and tamarack, and 25 for eastern redcedar; under 35 for all other species) were classified as unproductive forest land in 1977. Improved site index curves used in the 1990 survey placed many of these stands in the timberland category. The large increase in the black spruce and tamarack types in the

## Northern Pine Unit

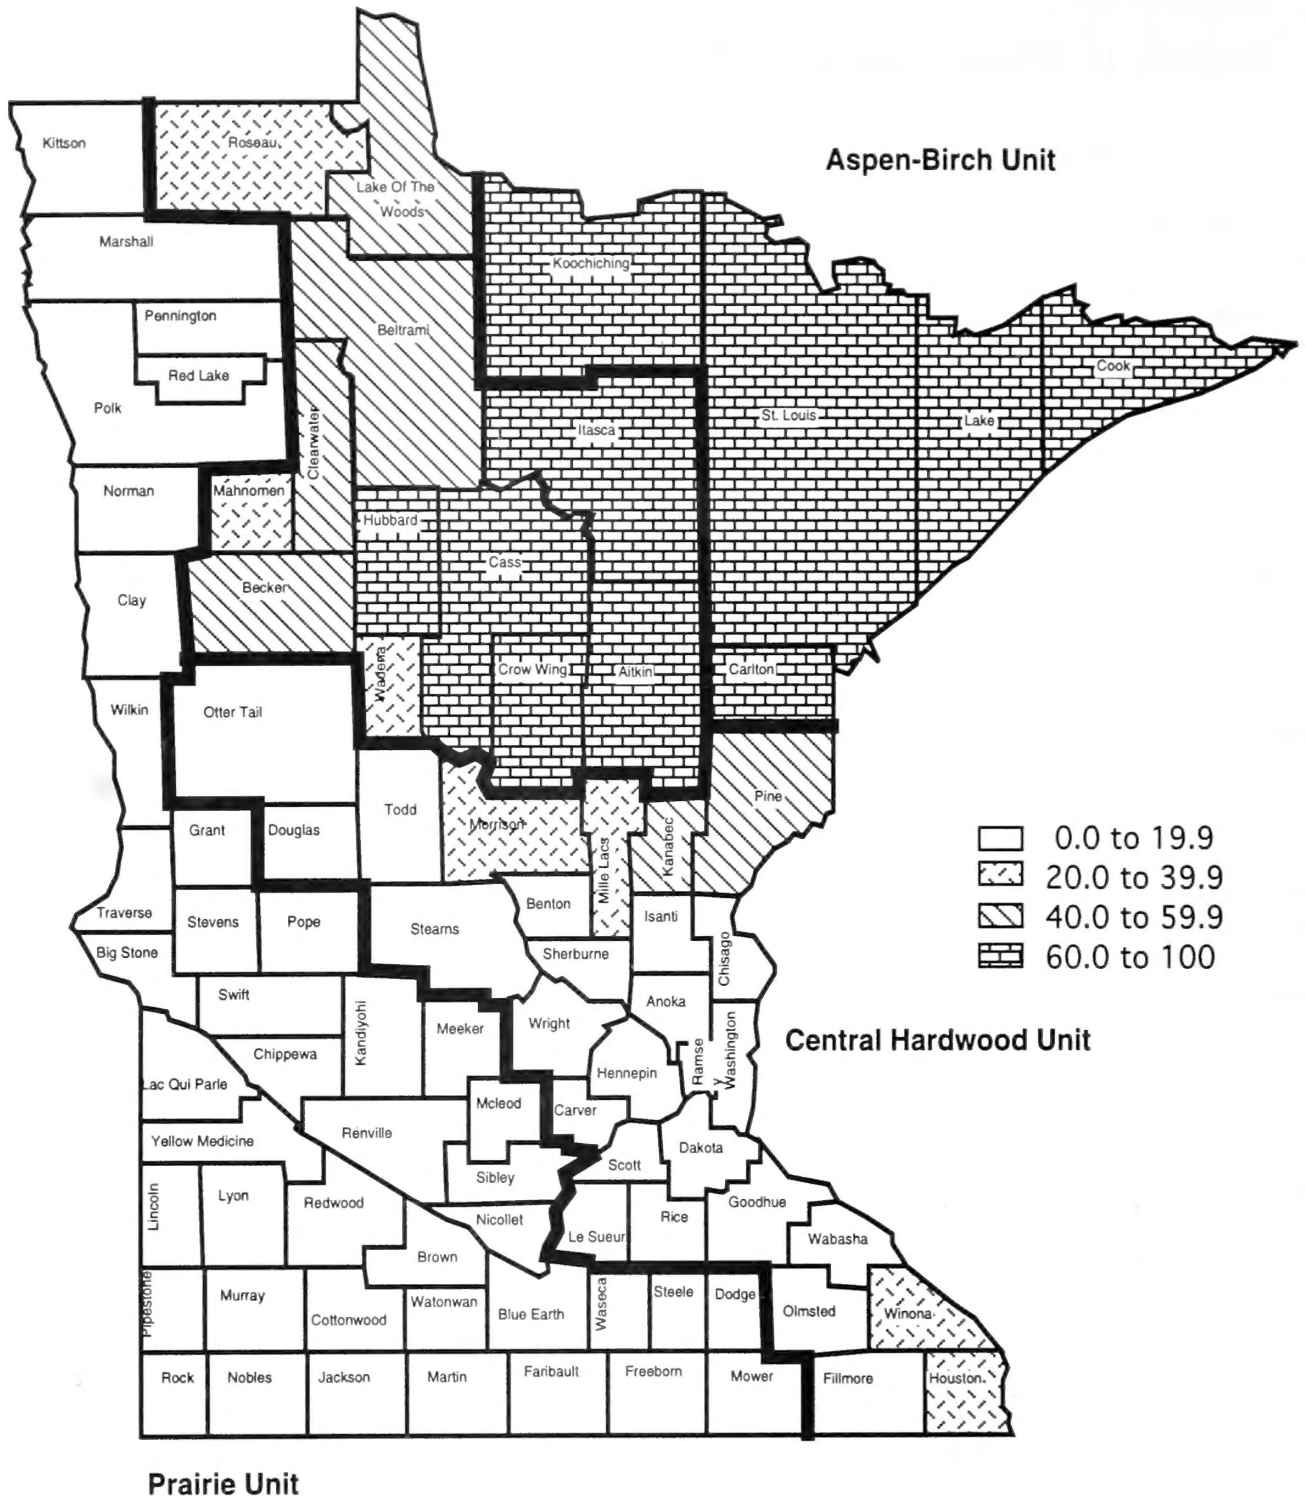

Figure 1.— Forest land as a percent of land area by county, Minnesota, 1990.

Aspen-Birch Unit is due mainly to these new site index curves. Another two-fifths of this increase can be attributed to the conversion of cropland or marshland to timberland.

- The highest concentration of timberland is in northeastern Minnesota (fig. 1). Of the four units, the Aspen-Birch Unit has the highest percentage of area in timberland (68 percent). The Northern Pine Unit is second with 53 percent timberland followed by the Central Hardwood Unit with 19 percent and the Prairie Unit with only 3 percent. The highest concentration of forest industry (pulp, saw, and fiberboard mills) is also in the north<sup>1</sup>. The Central Hardwood Unit, with 64 percent of the State's oak-hickory forest type, also plays an important role in the State's timber economy. Forest areas in the Prairie Unit are widely scattered but are important for recreation, wildlife, soil stabilization, and water quality.
- Private owners (individual, industry, corporate, and Indian) control 48.5 percent of the 14.7 million acres of timberland in Minnesota (fig. 2). State, county, and municipal governments administer 37.8 percent of the timberland in Minnesota.

<sup>1</sup> Smith, W. Brad; Dahlman, Rick. 1988. *Minnesota timber industry - an assessment of timber product output and use, 1988*. Resour. Bull. NC-127. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 61 p.

Figure 2.—Distribution of timberland by ownership, Minnesota, 1990.

- The area of sawtimber stands increased from 26 percent of the timberland area in 1977 to 33 percent in 1990 as poletimber stands grew into the sawtimber size class. The proportion of area in sapling-seedling stands also increased by approximately 7 percent, from 23 percent of timberland area in 1977 to 30 percent in 1990. This increase is attributable to the regeneration of former sawtimber and poletimber stands that had been harvested or disturbed by natural events.
- Stocking on timberland areas improved slightly between survey periods. In 1977 approximately 74 percent of timberland was moderately to well stocked. By 1990 this had increased to 78 percent.
- More than one-third of the timberland in Minnesota is in the aspen forest type (fig. 3), a proportion that remained relatively constant between the two surveys. The area in black spruce and northern white-cedar types increased by 25 percent, and the area of tamarack increased by more than 40 percent between inventories. These increases are due in large part to the reclassification of unproductive forest land to marginally productive timberland in 1990.

Figure 3.—Area of timberland by major forest type group, Minnesota, 1977 and 1990.

## Number of Trees

- In 1990 there were more than 2 billion growing-stock trees 5 inches and larger in diameter in Minnesota, an increase of nearly 10 percent from that reported in 1977. The number of growing-stock trees between 1 and 5 inches in diameter increased by 26 percent between 1977 (4.4 billion) and 1990 (5.6 billion).

## Volume

- Growing-stock volume increased from 12.4 billion cubic feet in 1977 to 15.1 billion cubic feet in 1990—a gain of 22 percent (fig. 4). During the same period, sawtimber volume increased from 24.4 billion board feet to 34.9 billion board feet, up 43 percent.

Figure 4.—Growing-stock volume by major forest type groups, Minnesota, 1977 and 1990.

- Growing-stock volume per acre increased from 909 cubic feet to 1,028 cubic feet between inventories. During the same period, sawtimber volume per acre increased from 1,795 to 2,371 board feet.
- Fifty-one percent of the growing-stock volume in Minnesota is on public lands (fig. 5). State and local governments administer 36 percent, and the Chippewa and Superior National Forests administer 14 percent. Private ownership of growing-stock volume is divided between individual (37 percent), forest industry (4 percent), corporate (4 percent), and Indian (4 percent).

Figure 5.—Growing-stock volume by ownership group, Minnesota, 1990.

- Hardwoods comprise 69 percent of the growing-stock volume in Minnesota, or about 10.5 billion cubic feet. Aspen (quaking and bigtooth) is the largest component of hardwoods, totaling 4.1 billion cubic feet or 39 percent of hardwood volume (fig. 6). Softwoods account for the other 31 percent of total timber volume. Spruce and fir are the largest constituent at 43 percent of softwood volume.

## Timber Growth, Mortality, and Removals

- Net annual growth of growing stock on timberland averaged 369.8 million cubic feet per year between 1977 and 1989, an average of 25.1 cubic feet of growth per acre per year, or 2.4 percent of the 1990 inventory.
- Average net annual growth for softwoods was 113.6 million cubic feet during the period from 1977 to 1989, or 2.4 percent of the 1990 softwood inventory (fig. 7). Hardwood average net annual growth was 256.3 million cubic feet—2.4 percent of the 1990 hardwood inventory. Almost half of the hardwood growth was in aspen. Average annual growth of aspen was 124.2 million cubic feet, or 3.0 percent of the 1990 aspen inventory. The rest of the hardwoods had an average annual growth of 132.1 million cubic feet—2.1 percent of their 1990 inventory.

### Softwoods: 4.6 Billion Cubic Feet

### Hardwoods: 10.5 Billion Cubic Feet

Figure 6.—Growing-stock volume by species group, Minnesota, 1990.

- Growing-stock mortality on timberland averaged 220.8 million cubic feet per year from 1977 to 1989, an average of 1.5 percent of the 1990 inventory.
- Average annual removals of growing stock from timberland during the period from 1977

to 1989 were 210.1 million cubic feet. Softwood removals averaged 54.9 million cubic feet per year (48.4 percent of growth) (fig. 7). Average annual aspen removals were 85.8 million cubic feet (69.1 percent of growth) over this period. All other hardwood removals averaged 69.3 million cubic feet (52.5 percent of growth).

- Current annual growth of growing stock on timberland was 439.8 million cubic feet in 1989, 2.9 percent of the 1990 inventory. Current growth per acre for 1989 was 29.9 cubic feet, 19 percent higher than average annual growth.
- Total current annual removals of growing stock on timberland in 1988 amounted to 261.2 million cubic feet. Aspen removals in 1988 totaled 144.1 million cubic feet, or 8 percent more than current annual growth in 1989.

Figure 7.—Average annual growth, removals, and mortality of growing stock on timberland by species type group, Minnesota, 1977-1989.

## Biomass

- All live tree biomass (trees at least 1 inch in diameter) on timberland averaged 60.1 green tons per acre in 1990. Seventy-one percent of the live tree biomass was in growing-stock trees. Cull trees accounted for 13.4 percent of the biomass, and trees between 1 and 5 inches in diameter accounted for the remaining 15.6 percent (fig. 8).
- The average biomass of tall and low shrubs (including trees less than 1 inch d.b.h.) in Minnesota was 3,056 pounds per acre green weight. Average biomass ranged from a high of 3,979 pounds per acre for the paper birch forest type to a low of 554 pounds per acre for the white pine forest type.

Figure 8.—All live tree biomass by component, Minnesota, 1990.

## APPENDIX

### ACCURACY OF THE SURVEY

Forest Inventory and Analysis information is based on a sampling procedure designed to provide reliable statistics at the State and Survey Unit levels. Consequently, the reported figures are estimates only. A measure of reliability of these figures is given by sampling errors. These sampling errors mean that the chances are two out of three that if a 100-percent inventory had been taken, using the same methods, the results would have been within the limits indicated.

For example, the estimated growing-stock volume in the State in 1990, 15,133.1 million cubic feet, has a sampling error of  $\pm 0.71$  percent ( $\pm 107.4$  million cubic feet). The growing-stock volume from a 100-percent inventory would be expected to fall between 15,025.7 and 15,240.5 million cubic feet ( $15,133.1 \pm 107.4$ ), there being a one in three chance that this is not the case.

The following tabulation shows the sampling errors for the Minnesota Forest Inventory:

Item	State totals	Sampling error
Growing stock	(Million cubic feet)	(Percent)
Volume (1990)	15,133.1	0.71
Average annual growth (1977-1989)	369.8	1.30
Average annual removals (1977-1989)	210.1	4.86
Sawtimber	(Million board feet)	
Volume (1990)	34,906.5	1.02
Average annual growth (1977-1989)	1,312.2	1.45
Average annual removals (1977-1989)	515.4	6.03
Timberland area (1990)	(Thousand acres) 14,723.2	0.36

## County Data

As survey data are broken down into sections smaller than State totals, the sampling error increases. For example, the sampling error for timberland area in a particular county is higher than that for total timberland area in the State. This tabulation shows the sampling errors for State totals. To estimate sampling error for data smaller than State totals, use the following formula:

$$E = \frac{(SE) \sqrt{(\text{State total volume or area})}}{\sqrt{(\text{Volume or area smaller than State total})}}$$

where:

E = sampling error in percent  
SE = State total error for volume or area

For example, to compute the error on the area of timberland in the aspen type for the State, proceed as follows:

The total area of aspen type in the State from table 3 = 5,055,000 acres

The total area of all timberland in the State from table 3 = 14,723,200 acres

The State total error for timberland area from the above tabulation = 0.0036 percent

Using the above formula:

$$\begin{aligned} \text{Sampling Error} &= \frac{(0.0036) \sqrt{14,723,200}}{\sqrt{5,055,000}} \\ &= \pm 0.61 \text{ percent} \end{aligned}$$

A standard FIA inventory is designed to provide sampling errors of no more than 3 percent per million acres of timberland or an overall error on Minnesota's nearly 15 million acres of about 0.8 percent. The State of Minnesota funded the collection of additional field data to reduce the sampling error by one-half. The overall goal was to provide a sampling error of less than 10 percent for total timberland area by county. This goal was achieved in the Aspen-Birch and Northern Pine Units and in most of the Central Hardwood Unit. It was not achieved in the Prairie Unit counties and in several counties in the Central Hardwood Unit. Sampling errors for area, volume, growth, and removals for both growing stock and sawtimber for each county in Minnesota are shown in table 79.

The sampling error within a county depends on county size and total area of timberland. Many large, heavily forested counties in the State have sampling errors well below 5 percent. However, in counties where timberland area is less than 35,000 acres, the sampling error for the total area in timberland will generally exceed 10 percent. The sampling error for total timber volume in a reporting area containing 35,000 acres of timberland will be about 20 percent. Individual county data for the Prairie and Central Hardwood Survey Units are provided in the following tabulation. All other tables reporting county level information use the county or county group names displayed below.

## COMPARING MINNESOTA'S FIFTH INVENTORY WITH THE FOURTH INVENTORY

The following paragraphs highlight some of the procedural changes since the last inventory to assist the reader in analyzing data from this report:

A new volume estimation procedure was developed for the Lake States (see Survey Procedures section), and this procedure was used to compute the 1989 volumes and to recompute the 1977 volume for growth calculations. Although the adjustment will differ by Survey Unit and species, the recomputed 1977 growing-stock and board foot volumes will generally be greater than those published in the 1977 report.

Past surveys used only growing-stock trees to determine stand-size class. Current survey procedures require that stand-size class be determined on the basis of all live trees. Therefore, direct comparisons of current inventory data to old inventory data by stand-size class may be misleading.

The basic building block for estimating forest area and timber volume has been changed from the Survey Unit to the county. In the past, the statistics were developed at the Unit level and prorated back to the county on the basis of photo-interpreted points. Direct development of county-level data helps users interested in more precise local data, but can make the outcome of comparisons with past estimates uncertain.

## SURVEY PROCEDURES

The 1990 Minnesota survey used a growth model-enhanced, two-phase sample design. Using this sampling scheme and associated estimators is similar to sampling with partial replacement (SPR), in that a set of randomly located plots is available for remeasurement and a random set of new plots is established and measured. A significant feature of the new Minnesota design is stratification for disturbance on the old sample and use of a growth model to improve regression estimates made on old undisturbed forest plots (fig. 9). Detailed descriptions of the sampling and estimation procedures are presented by Hansen (1990)<sup>2</sup>. The growth model used in the Minnesota survey design was the Lake States Stand and Tree Evaluation and Modeling System (STEMS)<sup>3</sup>.

<sup>3</sup> Belcher, David W.; Holdaway, Margaret R.; Brand, Gary J. 1982. *A description of STEMS the stand and tree evaluation and modeling system*. Gen. Tech. Rep. NC-79. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 18 p.

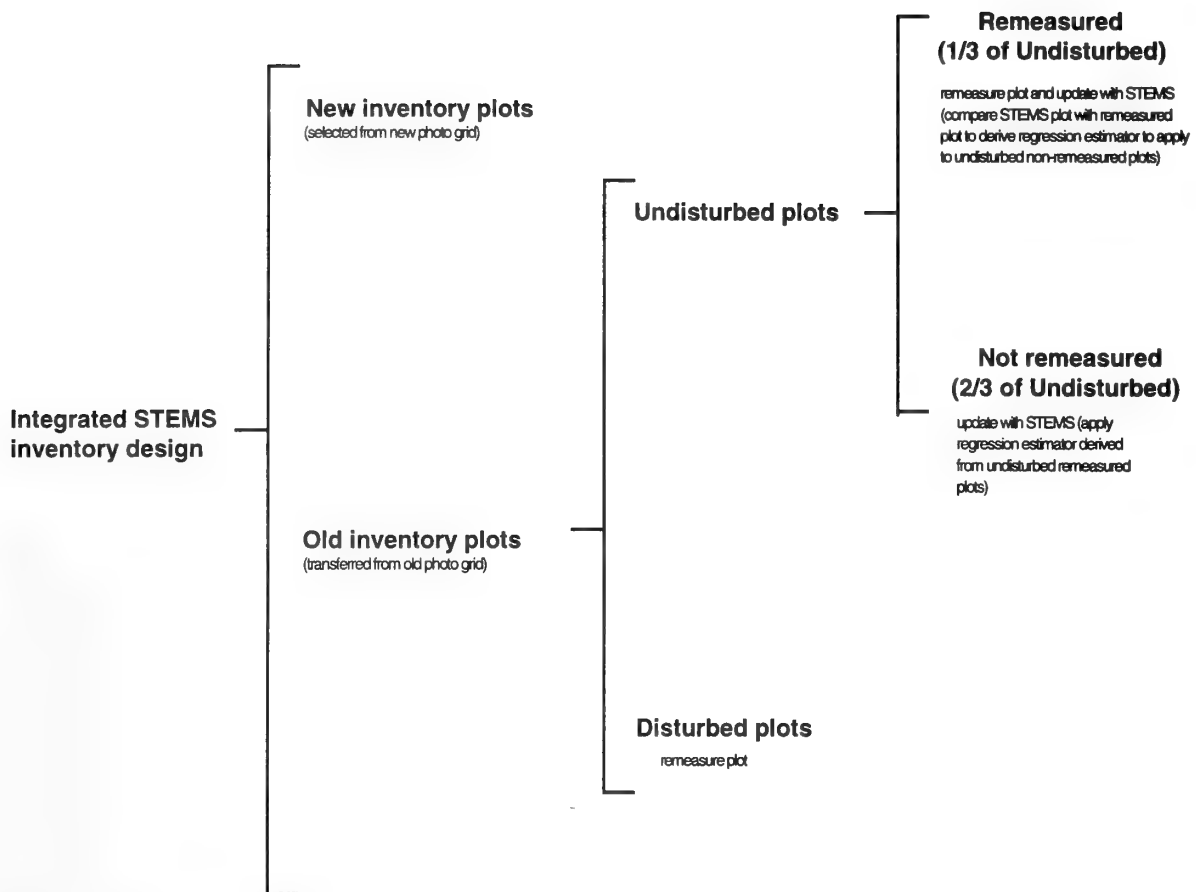

Figure 9.—Overview of the Minnesota sample design.

These were the major steps in the new survey design:

#### 1. Aerial photography (Phase 1)

In this phase two sets of random points were located on current aerial photography. The first is a set of new photo plots and the second is a set of relocated old ground plot locations from the 1977 inventory. Photos used in the Aspen-Birch and Northern Pine Units were 1:58,000 scale color infrared National High Altitude Photo program (NHAP) prints purchased by the Minnesota Department of Natural Resources (DNR) from the U.S. Geological Survey. Aerial photos used in the Central Hardwood and Prairie Units were 1:40,000 black and white National Aerial Photography Program (NAPP) photos furnished by the Agricultural Stabilization and Conservation Service (ASCS). In addition, the DNR provided 35mm true color prints at a scale of

1:15,840 of all of the 1977 ground plot locations. These 35mm prints were used in addition to the NHAP prints to help detect disturbances in the 1977 ground plot locations. The dates of photography for each Unit in the State are provided below. Dates of photography for individual counties can be found in their respective Unit reports. Photo interpretation for the Aspen-Birch Unit and Northern Pine Unit was performed by the DNR. FIA photo interpreters classified the Central Hardwood and Prairie Units.

Unit	Date	
	NHAP	35mm
Aspen-Birch	1981-1984	1986-1987
Northern Pine	1981-1985	1985-1989
Central Hardwoods	1976-1984	1988
Prairie	1978-1982	1988

The locations of the plots used in the 1977 inventory were transferred to these new photographs. The photographs were then assembled into township mosaics, and a systematic grid of 121 one-acre photo plots (each plot representing approximately 190.4 acres) was overlaid on each township mosaic. Each of these photo plots was examined by aerial photogrammetrists and classified stereoscopically based on land use. If trees were present, forest type and stand-size/density class were recorded. All of the 1977 ground plot locations were also examined for disturbance (logging, fire, catastrophic mortality, etc.) with the aid of the 35mm photographs. After this examination, all the old "disturbed" sample locations and one-third of the old "undisturbed" forested plots were sent to the field for survey crews to verify the photo classification and to take further measurements. All photo plot locations for the 1990 inventory were examined and were classified as shown in the following tabulation:

Photo land class	Photo plots
Timberland	73,506
Reserved forest land	5,906
Other forest land	5,918
Questionable	2,876
Nonforest with trees	4,503
Nonforest without trees	174,934
Water	16,777
All classes	284,420

## 2. Plot measurements (Phase 2)

On plots classified as timberland, wooded pasture, or windbreak (at least 120 feet wide), a ground plot was established, remeasured, or modeled. Old plots sent to the field for remeasurement that could not be relocated were replaced with a new plot at the approximate location of the old one. Each ground plot consists of a 10-point cluster covering approximately 1 acre. At each point, trees 5.0 inches or more in d.b.h. were sampled on a 37.5 Basal Area Factor (BAF) variable-radius plot, and trees less than 5.0 inches d.b.h. were sampled on a 1/300-acre fixed-radius plot. The measurement procedures for the new and old sample locations were as follows:

### a. New inventory plots

A systematic sample of the new photo plots was selected for field measurement. Ground plots were established, and measures of current classification such as land use, forest type, and ownership as well as size and condition of all trees on the plot were recorded. These locations were monumented for future remeasurement.

### b. Old inventory plots

These plots were established, monumented, and measured as part of the 1977 field inventory. The procedures for these old plots were different from those for the new plots. Old plots were classed as "undisturbed" or "disturbed" in the aerial photo phase of the sampling process. All disturbed plots and a one-third sample of the undisturbed plots were remeasured to obtain estimates of current condition and changes since the last inventory. All trees measured on these plots in 1977 were remeasured or otherwise accounted for, and all new trees were identified and measured.

All sample plots that were forested at the time of the 1977 inventory and that were determined to be undisturbed at the time of the 1990 inventory were projected to 1990 using STEMS. This procedure gives projected estimates of current volume and growth for these undisturbed plots. The comparison of the projected and observed values on the one-third sample of the undisturbed forest plots that were remeasured provided local calibration data to adjust the projected values of the undisturbed plots that were not remeasured. The adjustment procedure is a modified version of the method described by Smith<sup>4</sup>.

In the Aspen-Birch and Northern Pine Units, plots that were classified in Phase 1 as undisturbed nonforest were visually inspected from fixed wing aircraft to verify this classification. If the spotter felt the photo interpreter had misclassified the plot, the plot was ground checked by the field crew.

<sup>4</sup> Smith, W. Brad. 1983. *Adjusting the STEMS regional growth models to improve local predictions*. Res. Note NC-297. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 5 p.

The old sample plots that were not forested in 1977 and that were determined to be undisturbed until the current inventory (no evidence of conversion to another land use) were also sub-sampled (field checked) at the one-third rate. Any changes in land use to forest detected on these plots were used to adjust the two-thirds sample of these plots not field checked. The field check of these points in the Northern Pine Unit indicated that no adjustment was necessary.

The undisturbed forested plots that were not remeasured play a crucial role in the new survey design. These plots, after careful examination comparing past and current aerial photography, were determined to be undisturbed and had conditions that could be simulated by STEMS. The STEMS growth model was used to "grow" the old plot and tree data to produce an estimate of current data. Thus, these plots were treated as ground plots, even though they were never visited. The plot record for each modeled plot was sent to the field for verification of current ownership information.

All old plots classified as disturbed were sent to the field for remeasurement to assess and verify changes since the last inventory. Disturbance refers to any change on a plot that can be detected on aerial photos and that the STEMS growth processor cannot predict, such as catastrophic mortality, cutting, seedling stands, and land use change.

The estimation procedure for computing statistics from this sampling design was more complicated than the simple two-phase estimation procedure used in the past. In fact, this procedure yielded two independent samples, one coming from the new photo points and the other from the old photo points that are remeasured or modeled. The following tabulation summarizes the distribution of all ground plots for the new inventory design by type of plot:

Ground land use class	Old plots remeasured	Old plots updated	New plots	Total plots
Timberland	6,430	2,962	2,726	12,118
Reserved forest land	27	20	630	677
Other forest land	250	424	149	823
Nonforest with trees	462	92	127	681
Nonforest without trees	8,357	14,994	3,991	27,342
Water	583	1,050	685	2,318
Total	16,109	19,542	8,308	43,959

### 3. Area estimates

Area estimates were made using two-phase estimation methods. In this type of estimation, a preliminary estimate of area by land use is made from the aerial photographs (Phase 1) and corrected by the plot measurements (Phase 2). A complete description of this estimation method is presented by Loetsch and Haller (1964)<sup>5</sup>.

### 4. Volume estimates

Estimates of volume per acre were made from the trees measured or modeled on the 10-point plots. Estimates of volume per acre were multiplied by the area estimates to obtain estimates of total volume. Net cubic foot volumes are based on a modification of the method presented by Hahn (1984)<sup>6</sup> for use in the Lake States. For the Minnesota inventory, the merchantable height equation presented was used in conjunction with Stone's equation (see Appendix I in Hahn 1984) to estimate gross volume. This estimate was then corrected by species for variation in bark and cull volume to yield an estimate of net volume, using the coefficients presented in Hahn (1984).

The Forest Service reports all board foot volume in International 1/4-inch rule. In Minnesota, the Scribner log rule is commonly used. Scribner log rule conversion factors were derived from full tree measurements taken throughout the Lake States (Michigan,

<sup>5</sup> Loetsch, F.; Haller, K.E. 1964. *Forest inventory, volume I, statistics of forest inventory and information from aerial photographs*. Vienna: BLV Verlagsgesellschaft Munch Basle. 436 p.

<sup>6</sup> Hahn, Jerold T. 1984. *Tree volume and biomass equations for the Lake States*. Res. Pap. NC-250. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 10 p.

Wisconsin, and Minnesota) and an equation developed by Wiant and Castenaeda (1977)<sup>7</sup>. The factors (multipliers) used to convert board foot International volumes to the Scribner rule are shown in the tabulation below:

D.b.h. (inches)	Scribner rule conversion factor	
	Softwoods	Hardwoods
9.0-10.9	0.7830	—
11.0-12.9	.8287	0.8317
13.0-14.9	.8577	.8611
15.0-16.9	.8784	.8827
17.0-18.9	.8945	.8999
19.0-20.9	.9079	.9132
21.0-22.9	.9168	.9239
23.0-24.9	.9240	.9325
25.0-26.9	.9299	.9396
27.0-28.9	.9321	.9454
29.0+	.9357	.9544

5. Growth and mortality estimates

On remeasured plots, estimates of growth and mortality per acre derive from the remeasured diameters of trees and from observation of trees that died between inventories. Growth reported as the average net annual growth between the two inventories (1977 and 1990) is computed from data on remeasurement plots and modeled plots using methods presented by VanDeusen *et al.* (1986)<sup>8</sup>. Mortality is also average annual for the remeasurement period. On new plots, where trees were not remeasured, estimates of growth and mortality were obtained by using STEMS to project the growth and mortality of trees for 1 year. Growth and mortality estimates for old undisturbed plots that were updated were derived in the same manner as remeasured plots. The STEMS growth model was adjusted by Survey Unit to meet local conditions, using data from the undisturbed remeasurement plots. As with volume, total growth and mortality estimates were obtained by multiplying the per acre estimates by area estimates. Current annual growth for 1989 was computed by

using the adjusted STEMS model to grow all current inventory plots for 1 year.

6. Average annual removals estimates

Average annual growing-stock and sawtimber removals (1977 to 1989) were estimated only from the remeasured plots; new plots and STEMS-projected plots were not used to estimate removals. These estimates are obtained from trees measured in the last survey and cut or otherwise removed from the timberland base. Because remeasurement plots make up about one-half of the total ground plots, average annual removals estimates have greater sampling errors than volume and growth estimates.

Tree and Log Grade

Log grades and/or tree grades were assigned on approximately one-third of the sample plots in Minnesota. All sawtimber softwood sample trees were graded for quality and assigned a log grade. Log grades were also assigned to hardwood sawtimber trees in the Aspen-Birch and Northern Pine Units. Tree grades were assigned to hardwood sawtimber trees in the Prairie and Central Hardwood Units.

Log grades and tree grades are based on the classification of external characteristics as indicators of quality. The volume yield by log grade or tree grade for this sample was used to distribute the volume of the ungraded sample trees by species group. For example, in table 15, the volume in log grade 1 in the Aspen-Birch Unit (545,535 thousand board feet) represents all of the volume in that Unit in trees whose lowest log was given a log grade of 1.

Hardwood sawtimber trees in the Central Hardwood and Prairie Units were graded according to "Hardwood tree grades for factory lumber."<sup>9</sup> The best 12-foot section of the lowest 16-foot hardwood log was used for grading. Hardwood sawtimber trees that did not meet

<sup>7</sup> Wiant, Harry V., Jr.; Castenaeda, Froylan. 1977. *Mesavage and Girard's volume tables formulated.* BLM4. Denver, CO: U.S. Department of the Interior, Bureau of Land Management, Denver Service Center: 1-4.

minimum tree grade specifications for grades 1 through 3 were assigned grade 4 according to Forest Service standard specifications for hardwood construction logs described in "A guide to hardwood log grading."<sup>10</sup>

Hardwood sawtimber trees in the Aspen-Birch and Central Hardwood Units were graded according to "A guide to hardwood log grading." The best 12-foot section of the lowest 16-foot hardwood log, or the best 12-foot upper section if the butt log did not meet minimum log-grade standards, was used for grading.

Red pine and jack pine sawtimber trees were graded based on specifications described in "Forest Service log grades for southern pines."<sup>11</sup> White pine and other softwood sawtimber trees were graded according to specifications described in "Saw log grades for eastern white pine,"<sup>12</sup> from the University of Wisconsin. For all softwoods, the first merchantable 16-foot log, or shorter lengths down to 12 feet, was used for grading.

<sup>12</sup> Ostrander, Myron D.; Brisbin, Robert L. 1971. *Saw log grades for eastern white pine*. Res. Pap. NE-205. Upper Darby, PA: U.S. Department of Agriculture, Forest Service, Northeastern Forest Experiment Station. 24 p.

**Hardwood Tree Grades for Factory Lumber<sup>a</sup>**  
**(Used in Central Hardwood and Prairie Units)**

Grade factor	Tree grade 1	Tree grade 2	Tree grade 3
Length of grading zone (feet)	Butt 16	Butt 16	Butt 16
Length of grading section <sup>b</sup> (feet)	Best 12	Best 12	Best 12
D.b.h., minimum (inches)	16 <sup>c</sup>	13	11
Diameter, minimum inside bark at top of grading section (inches)	13 <sup>c</sup> 16 20	11 <sup>d</sup> 12	8
Clear cuttings (on the three best faces) <sup>e</sup>			
Length, minimum (feet)	7 5 3	3 3	2
Number on face (maximum)	2	2 3	f
Yield in face length (minimum)	5/6	4/6	3/6
Cull deduction (including crook and sweep, but excluding shake) maximum within grading section (percent)	9	99	50

- <sup>a</sup> Hanks, Leland F. 1976. *Hardwood tree grades for factory lumber*. Res. Pap. NE-333. Broomall, PA: U.S. Department of Agriculture, Forest Service, Northeastern Forest Experiment Station. 81 p.
- <sup>b</sup> Whenever a 14- or 16-foot section of the butt 16-foot log is better than the best 12-foot section, the grade of the longer section will become the grade of the tree. This longer section, when used, is the basis for determining the grading factors such as diameter and cull deduction.
- <sup>c</sup> In basswood and ash, d.i.b. at top of grading section must be 12 inches and d.b.h. must be 15 inches.
- <sup>d</sup> Grade 2 trees can be 10 inches d.i.b. at top of grading section if they otherwise meet surface requirements for small grade 1's.
- <sup>e</sup> A clear cutting is a portion of a face free of defects, extending the width of the face. A face is one-fourth of the surface of the grading section as divided lengthwise.
- <sup>f</sup> Unlimited.
- <sup>g</sup> Fifteen percent crook and sweep or 40 percent total cull deduction are permitted in grade 2 trees, if size and surface of grading section qualify as grade 1. If rot shortens the required clear cuttings to the extent of dropping the butt log to grade 2, do not drop the tree's grade to 3 unless the cull deduction for rot is greater than 40 percent.

**Forest Service standard grades for hardwood  
factory saw logs<sup>a</sup>**  
(Used in Aspen-Birch and Northern Pine Units)

Grading factors		Log grades							
		Log grade 1			Log grade 2				Log grade 3
Position in tree		Butts only	Butts & uppers		Butts & uppers				Butts & uppers
Scaling diameter, inches		13-15 <sup>b</sup>	16-19	20+	11+ <sup>c</sup>	12+			8+
Length without trim, feet		10+			10+	8-9	10-11	12+	8+
Required clear cuttings <sup>d</sup> of each of three best faces <sup>e</sup>	Min. length, feet	7	5	3	3	3	3	3	2
	Max. number	2	2	2	2	2	2	3	No limit
	Min. proportion of log length required on clear cutting	5/6	5/6	5/6	2/3	3/4	2/3	2/3	1/2
Maximum sweep & crook allowance	For logs with less than 1/4 of end in sound defects	15%			30%				50%
	For logs with more than 1/4 of end in sound defects	10%			20%				35%
Max. scaling deduction		40% <sup>f</sup>			50% <sup>g</sup>				50%
End defect:	See special instructions in FPL-63.								

<sup>a</sup> From USDA Forest Service Research Paper FPL-63.

<sup>b</sup> Ash and basswood butts can be 12 inches if they otherwise meet requirements for small #1's.

<sup>c</sup> Ten-inch logs of all species can be #2 if they otherwise meet requirements for small #1's.

<sup>d</sup> A clear cutting is a portion of a face, extending the width of the face, that is free of defects.

<sup>e</sup> A face is one-fourth of the surface of the log as divided lengthwise.

<sup>f</sup> Otherwise #1 logs with 41-60 percent deductions can be #2.

<sup>g</sup> Otherwise #2 logs with 51-60 percent deductions can be #3.

**Forest Service Standard Specifications for Hardwood Construction Logs (tie and timber logs)<sup>1</sup>**

Position in tree	Butts and uppers
Min. diameter, small end	8 inches +
Min. length without trim	8 feet
Clear cuttings	No requirements
Sweep allowance	One-fourth of the diameter at the small end for each 8 feet of length.
Sound surface defects:	
Single knots	Any number, if no one knot has an average diameter above the callus in excess of one-third of the log diameter at point of occurrence.
Whorled knots	Any number, if the sum of knot diameters above the callus does not exceed one-third of the log diameter at point of occurrence.
Holes	Any number, provided none has a diameter over one-third of the log diameter at point of occurrence and none extends more than 3 inches into included timber <sup>2</sup> .
Unsound surface defects :	Same requirements as for sound defects if they extend into included timber. No limit if they do not.

<sup>1</sup> These specifications are minimum for the class. If, from a group of logs, factory logs are selected first, thus leaving only nonfactory logs from which to select construction logs, then the quality range of the construction logs so selected is limited, and the class may be considered a grade. If selection for construction logs is given first priority, it may be necessary to subdivide the class into grades.

<sup>2</sup> Included timber is always square, and dimension is judged from small end.

### Eastern White Pine Saw Log Grade Specifications<sup>a</sup>

Grading factor	Log grade 1	Log grade 2	Log grade 3	Log grade 4
1. Minimum scaling diameter (inches)	14 <sup>b</sup>	6	6	6
2. Minimum log length (feet)	10 <sup>c</sup>	8	8	8
3. Maximum weevil injury (number)	None	None	2 <sup>d</sup>	No limit
4. Minimum face requirements	Two full length or four 50% <sup>e</sup> length good faces (in addition, log knots on balance of faces shall not exceed size limit of grade 2 logs).	<b>NO GOOD FACES REQUIRED</b> Maximum diameter of log knots on three best faces: <b>SOUND RED KNOTS</b> not to exceed 1/6 scaling diameter and 3" maximum <b>OVERGROWN/DEAD/BLACK KNOTS</b> not to exceed 1/12 scaling diameter and 1 1/2" max.		Includes all logs not qualifying for No. 3 or better and having at least 1/3 of their gross volume in sound wood suitable for manufacture into standard lumber
5. Maximum sweep or crook (%)	20	30	40	66 2/3
6. Maximum total scaling deduction (%)	50	50	50	66 2/3

**AFTER THE TENTATIVE LOG GRADE IS ESTABLISHED FROM FACE EXAMINATION, THE LOG WILL BE REDUCED IN GRADE WHENEVER THE FOLLOWING DEFECTS ARE EVIDENT:**

7. Conks, punk knots, and pine borer damage on bark surface <sup>f</sup>.

Degrade one grade if present on one face.

Degrade two grades if present on two faces.

Degrade three grades if present on three or more faces.

8. Log end defects: red rot, ring shake, heavy stain, and pine borer damage outside the heart center of log<sup>e</sup>. Consider log as having a total of 8 quarters (4 on each end) and degrade as indicated.

Degrade one grade if present in 2 quarters of log ends.

Degrade two grades if present in 3 or 4 quarters of log ends.

Degrade three grades if present in 5 or more quarters of log ends.

<sup>a</sup> Ostrander, Myron D.; Brisbin, Robert L. 1971. Saw log grades for eastern white pine. Res. Pap. NE-205. Upper Darby, PA: U.S. Department of Agriculture, Forest Service, Northeastern Forest Experiment Station. 24 p.

<sup>b</sup> 12- and 13-inch logs with four full-length good faces are acceptable.

<sup>c</sup> 8-foot logs with four full-length good faces are acceptable.

<sup>d</sup> 8-foot Number 3 logs limited to one weevil injury.

<sup>e</sup> Minimum 50% length good face must be at least 6 feet.

<sup>f</sup> Factors 7 and 8 are not cumulative (total degrade based on more serious of the two). No log is to be degraded below grade 4 if net scale is at least one-third of gross scale.

## Log Grades for Jack Pine and Red Pine

---

*Grade 1:* Trees with three or four clear faces on the 16-foot grading section.<sup>1</sup>

*Grade 2:* Trees with one or two clear faces on the 16-foot grading section.

*Grade 3:* Trees with no clear faces on the 16-foot grading section.

After the tentative grade is established from above, the tree will be reduced one grade for each of the following, except that no tree can be reduced below grade 3, provided the total scaling deductions for sweep and/or rot do not exceed two-thirds of the gross scale of the tree.

1. *Sweep.* Degrade any tentative grade 1 or 2 tree one grade if sweep in the lower 12 feet of grading sections amounts to 3 or more inches and equals or exceeds one-fourth of the diameter at breast height.

2. *Heart rot.* Degrade any tentative grade 1 or 2 tree one grade if conk, punk knots, massed hyphae, or other evidence of advanced heart rot is found anywhere on the main tree stem.

---

<sup>1</sup>A face is one-fourth of the circumference in width extending full length of the grading section. Clear faces are those free of: knots measuring more than one-half inch in diameter, overgrown knots of any size, and holes more than one-fourth inch in diameter. Faces may be rotated to obtain the maximum number of clear on the grading section.

## Log Grades for All Other Softwood Logs

---

### *Grade 1*

1. Trees must be 16 inches in diameter or larger, grading section 12 feet in length or longer, and with deduction for defect not over 30 percent of gross scale.
2. Trees must be at least 75 percent clear on each of three faces.
3. All knots outside clear cutting must be sound and not more than 2-1/2 inches in size.

### *Grade 2*

1. Trees must be 12 inches in diameter or larger, grading section 12 feet in length or longer, and with a net scale after deduction for defect of at least 50 percent of the gross scale deducted for defect.
2. Trees must be at least 50 percent clear on each of three faces or 75 percent clear on two faces.

### *Grade 3*

1. Trees must be 6 inches in diameter or larger, grading section 12 feet in length or longer, and with a net scale after deduction for defect of at least 50 percent of the gross contents of the log.

---

*Note:* A) Diameters are diameter inside bark (DIB) at small end of grading section.  
B) Percent clear refers to percent clear in one continuous section.

## METRIC EQUIVALENTS OF UNITS USED IN THIS REPORT

- 1 acre = 4,046.86 square meters or 0.405 hectare.  
1,000 acres = 405 hectares.  
1 cubic foot = 0.0283 cubic meter.  
1 foot = 30.48 centimeters or 0.3048 meter.  
1 inch = 25.4 millimeters, 2.54 centimeters, or 0.0254 meter.  
1 pound = 0.454 kilograms.  
1 ton = 0.907 metric tons.

## TREE SPECIES GROUPS IN MINNESOTA<sup>13</sup>

### SOFTWOODS

- Eastern white pine ..... *Pinus strobus*  
Red pine ..... *Pinus resinosa*  
Jack pine ..... *Pinus banksiana*  
White spruce ..... *Picea glauca*  
Black spruce ..... *Picea mariana*  
Balsam fir ..... *Abies balsamea*  
Tamarack ..... *Larix laricina*  
Northern white-cedar ..... *Thuja occidentalis*  
Other softwoods:  
    Eastern redcedar ..... *Juniperus virginiana*  
    Scotch pine ..... *Pinus sylvestris*  
    Ponderosa pine ..... *Pinus ponderosa*

### HARDWOODS

American hornbeam ..... *Carpinus caroliniana*  
Hawthorn ..... *Crataegus* spp.  
Apple ..... *Malus* spp.  
Eastern hophornbeam ..... *Ostrya virginiana*  
Pincherry ..... *Prunus pensylvanica*  
Wild plum ..... *Prunus* spp.  
Chokecherry ..... *Prunus virginiana*  
Peachleaf willow ..... *Salix amygdaloides*  
American mountain ash ..... *Sorbus americana*

## DEFINITION OF TERMS

### Average annual mortality of growing stock.—

The average cubic foot volume of sound wood in growing-stock trees that died in one year. Average annual mortality is reported for a period of several years (1977 to 1990 in this report).

### Average annual mortality of sawtimber.—

The average board foot volume of sound wood in sawtimber trees that died in one year. Average annual mortality is reported for a period of several years (1977 to 1990 in this report).

**Average annual removals from growing stock.**—The average net growing-stock volume in growing-stock trees removed annually for roundwood forest products, in addition to the volume of logging residues and the volume of other removals. Average annual removals of growing stock are reported for a period of several years (1977 to 1989 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures in Appendix).

**Average annual removals from sawtimber.**—The average net board foot sawtimber volume of live sawtimber trees removed annually for roundwood forest products, in addition to the volume of logging residues and the volume of other removals. Average annual removals of sawtimber are reported for a period of several years (1977 to 1989 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures in Appendix).

**Average net annual growth of growing stock.**—The annual change in cubic foot volume of sound wood in live sawtimber and poletimber trees and the total volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes.

**Average net annual growth of sawtimber.**—The annual change in the volume of live sawtimber trees and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes.

**Basal area.**—Tree area in square feet of the cross section at breast height of a single tree. When the basal areas of all trees in a stand are summed, the result is usually expressed as square feet of basal area per acre.

**Biomass.**—The aboveground volume of all live trees (including bark but excluding foliage) reported in green tons. Biomass has four components:

*Bole.*—Biomass of a tree from 1 foot above the ground to a 4-inch top outside bark.

*Tops and limbs.*—Total biomass of a tree from a 1-foot stump minus the bole.

*1- to 5-inch trees.*—Total aboveground biomass of a tree from 1 to 5 inches in diameter at breast height.

*Stump.*—Biomass of a tree 5 inches d.b.h. and larger from the ground to a height of 1 foot.

**Commercial species.**—Tree species presently or prospectively suitable for industrial wood products. (Note: Excludes species of typically small size, poor form, or inferior quality, such as hophornbeam, osage-orange, and redbud.)

**Cord.**—One standard cord is 128 cubic feet of stacked wood, including bark and air space. Cubic feet can be converted to standard cords by dividing by 79.

**Corporate.**—Lands owned by a private corporation not in the business of operating primary wood-using plants.

**County and municipal land.**—Land owned by counties and local public agencies or municipalities, or land leased to these governmental units for 50 years or more.

**Cropland.**—Land under cultivation within the last 24 months; including cropland harvested, crop failures, cultivated summer fallow, idle cropland used only for pasture, orchards, and land in soil improvement crops, but excluding land cultivated in developing improved pasture.

**Cull.**—Portions of a tree that are unusable for industrial wood products because of rot, form, missing or dead material, or other defect.

**Current annual growth of growing stock.**—The annual change in volume of sound wood in live sawtimber and poletimber trees and the total volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes. Current growth is based on an estimate of the current annual increment of each growing stock tree in the inventory, and is reported for a single year—1989 in this report.

**Current annual growth of sawtimber.**—The annual change in the volume of live sawtimber trees and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes. Current growth is based on an estimate of the current annual increment of each growing stock tree in the inventory, and is reported for a single year—1989 in this report.

**Current annual removals from growing stock.**—The current net growing-stock volume in growing-stock trees removed annually for

roundwood forest products, in addition to the volume in logging residues and the volume in other removals. Current annual removals of growing stock are reported for a single year (1988 in this report) and are based on a survey of primary wood processing mills to determine removals for products, and on information from remeasurement plots (see Survey Procedures in Appendix) to determine removals due to land use change.

**Current annual removals from sawtimber.—**

The current net board foot sawtimber volume of live sawtimber trees removed annually for roundwood forest products, in addition to the volume in logging residues, and the volume in other removals. Current annual removals of sawtimber are reported for a single year (1988 in this report) and are based on a survey of primary wood processing mills to determine removals for products and on information from remeasurement plots (see Survey Procedures in Appendix) to determine removals due to land use change.

**Diameter class.**—A classification of trees based on diameter outside bark, measured at breast height (d.b.h.) 4.5 feet above the ground. Two-inch diameter classes are commonly used in Forest Inventory and Analysis, with the even inch the approximate midpoint for a class. For example, the 6-inch class includes trees 5.0 through 6.9 inches d.b.h.

**Diameter at breast height (d.b.h.).**—The outside bark diameter at 4.5 feet (1.37m) above the forest floor on the uphill side of the tree. For determining breast height, the forest floor includes the duff layer that may be present, but does not include unincorporated woody debris that may rise above the ground line.

**Farm.**—Any place from which \$1,000 or more of agricultural products were produced and sold during the year.

**Farmer-owned land.**—(See Individual private land.)

**Forest industry land.**—Land owned by companies or individuals that operate a primary wood-using plant.

**Forest land.**—Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, and not currently

developed for nonforest use. (Note: Stocking is measured by comparing specified standards with basal area and/or number of trees, age or size, and spacing.) The minimum area for classification of forest land is 1 acre. Roadside, streamside, and shelterbelt strips of timber must have a crown width of at least 120 feet to qualify as forest land. Unimproved roads and trails, streams, or other bodies of water or clearings in forest areas shall be classed as forest if less than 120 feet wide. (See Tree, Land, Timberland, Reserved forest land, Other forest land, Stocking, and Water.)

**Forest type.**—A classification of forest land based on the species forming a plurality of live tree stocking. Major forest types in the State are:

*Jack pine.*—Forests in which jack pine comprises a plurality of the stocking. (Common associates include eastern white pine, red pine, aspen, birch, and maple.)

*Red pine.*—Forests in which red pine comprises a plurality of the stocking. (Common associates include eastern white pine, jack pine, aspen, birch, and maple.)

*White pine.*—Forests in which eastern white pine comprises a plurality of the stocking. (Common associates include red pine, jack pine, aspen, birch, and maple.)

*Balsam fir.*—Forests in which balsam fir and white spruce comprise a plurality of stocking with balsam fir the most common. (Common associates include aspen, maple, birch, northern white-cedar, and tamarack.)

*White spruce.*—Forests in which white spruce and balsam fir comprise a plurality of the stocking with white spruce the most common. (Common associates include aspen, maple, birch, northern white-cedar, and tamarack.)

*Black spruce.*—Forests in which swamp conifers comprise a plurality of the stocking with black spruce the most common. (Common associates include tamarack and northern white-cedar.)

*Northern white-cedar.*—Forests in which swamp conifers comprise a plurality of the stocking with northern white-cedar the most common. (Common associates include tamarack and black spruce.)

*Tamarack.*—Forests in which swamp conifers comprise a plurality of the stocking with tamarack the most common. (Common associates include black spruce and northern white-cedar.)

**Oak-hickory.**—Forests in which northern red oak, white oak, bur oak, or hickories, singly or in combination, comprise a plurality of the stocking. (Common associates include jack pine, elm, and maple.)

**Elm-ash-soft maple.**—Forests in which lowland elm, ash, red maple, silver maple, and cottonwood, singly or in combination, comprise a plurality of the stocking. (Common associates include birches, spruce, and balsam fir.)

**Maple-basswood.**—Forests in which sugar maple, basswood, yellow birch, upland American elm, and red maple, singly or in combination, comprise a plurality of the stocking. (Common associates include white pine, elm, and basswood.)

**Aspen.**—Forests in which quaking aspen or bigtooth aspen, singly or in combination, comprise a plurality of the stocking. (Common associates include balsam poplar, balsam fir, and paper birch.)

**Paper birch.**—Forests in which paper birch comprises a plurality of the stocking. (Common associates include maple, aspen, and balsam fir.)

**Balsam poplar.**—Forests in which balsam poplar comprises a plurality of the stocking. (Common associates include aspen, elm, and ash.)

**Growing-stock tree.**—A live tree of commercial species that meets specified standards of size, quality, and merchantability. (Note: Excludes rough, rotten, and dead trees.)

**Growing-stock volume.**—Net volume in cubic feet of growing-stock trees 5.0 inches d.b.h. and over, from 1 foot above the ground to a minimum 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

**Hard hardwoods.**—Hardwood species with an average specific gravity greater than 0.50, such as oaks, hard maple, hickories, and ash.

**Hardwoods.**—Dicotyledonous trees, usually broad-leaved and deciduous. (See Soft hardwoods and Hard hardwoods.)

**Improved pasture.**—Land currently improved for grazing by cultivating, seeding, irrigating, or clearing trees or brush and less than 16.7 percent stocked with trees.

**Indian land.**—Land held in trust by the United States for tribes or individual Indians.

**Individual private land.**—Privately owned land excluding land owned by forest industry. This class includes the Farmer class and Miscellaneous private class.

**Industrial wood.**—All roundwood products except residential fuelwood.

**Land.**—(a) *Bureau of the Census.* Dry land and land temporarily or partly covered by water such as marshes, swamps, and river flood plains (omitting tidal flats below mean high tide); streams, sloughs, estuaries, and canals less than one-eighth of a statute mile wide; and lakes, reservoirs, and ponds less than 40 acres in area.

(b) *Forest Inventory and Analysis.* The same as the Bureau of the Census, except minimum width of streams, etc., is 120 feet and minimum size of lakes, etc., is 1 acre.

**Live trees.**—Growing-stock, rough, and rotten trees 1.0 inch d.b.h. and larger.

**Log grade.**—A log classification based on external characteristics as indicators of quality or value. (See Appendix for specific grading factors used.)

**Logging residue.**—The unused portions of trees cut or killed by logging.

**Marsh.**—Nonforest land that characteristically supports low, generally herbaceous or shrubby vegetation, and that is intermittently covered with water.

**Merchantable.**—Refers to a pulpwood or saw-log section that meets pulpwood or saw-log specifications, respectively.

**Miscellaneous Federal land.**—Federal land other than National Forest and land administered by the Bureau of Land Management or Bureau of Indian Affairs.

**Miscellaneous private land.**—(See Individual private land.)

**National Forest land.**—Federal land that has been legally designated as National Forest or purchase units, and other land administered by the USDA Forest Service.

**Net volume.**—Gross volume less deductions for rot, sweep, or other defect affecting use for timber products.

**Noncommercial species.**—Tree species of typically small size, poor form, or inferior quality that normally do not develop into trees suitable for industrial wood products.

**Nonforest land.**—Land that has never supported forests, and land formerly forested where use for timber management is precluded by development for other uses. (Note: Includes areas used for crops, improved pasture, residential areas, city parks, improved roads of any width and adjoining clearings, powerline clearings of any width, and 1- to 40-acre areas of water classified by the Bureau of the Census as land. If intermingled in forest areas, unimproved roads and nonforest strips must be more than 120 feet wide and more than 1 acre in area to qualify as nonforest land.)

a. *Nonforest land without trees.*—Nonforest land with no live trees present.

b. *Nonforest land with trees.*—Nonforest land with one or more trees per acre at least 5 inches d.b.h.

**Nonstocked land.**—Forest land less than 16.7 percent stocked with all live trees.

**Other forest land.**—Forest land not capable of producing 20 cubic feet per acre per year of industrial wood crops under natural conditions and not associated with urban or rural development. Many of these sites contain tree species that are not currently utilized for industrial wood production or trees of poor form, small size, or inferior quality that are unfit for industrial products. Unproductivity may be the result of adverse site conditions such as sterile soil, dry climate, poor drainage, high elevation, and rockiness. This land is not withdrawn from timber utilization.

**Other removals.**—Growing-stock trees removed but not utilized for products, or trees left standing but “removed” from the timberland classification by land use change. Examples are removals from cultural operations such as timber stand improvement work, land clearing, and changes in land use.

**Ownership size class.**—The amount of timberland owned by one owner, regardless of the number of parcels.

**Ownership tenure.**—The length of time a property has been held by the owner.

**Pasture.**—Land presently used for grazing or under cultivation to develop grazing.

**Physiographic class.**—A measure of soil and water conditions that affect tree growth on a site. The physiographic classes are:

*Xeric sites.*—Very dry soils where excessive drainage seriously limits both growth and species occurrence. Example: sandy jack pine plains.

*Xeromesic sites.*—Moderately dry soils where excessive drainage limits growth and species occurrence to some extent. Example: dry oak ridge.

*Mesic sites.*—Deep, well-drained soils. Growth and species occurrence are limited only by climate. Example: well-drained terraces of loamy soil.

*Hydromesic sites.*—Moderately wet soils where insufficient drainage or infrequent flooding limits growth and species occurrence to some extent. Example: moderately drained bottomland hardwood sites.

*Hydric sites.*—Very wet sites where excess water seriously limits both growth and species occurrence. Example: frequently flooded river bottoms and black spruce swamps.

**Plant byproducts.**—Plant residues used for products such as mulch, pulp chips, and fuelwood.

**Plant residues.**—Wood and bark materials generated at manufacturing plants during production of other products.

**Plantation.**—An artificially reforested area sufficiently productive to qualify as timberland. The planted species is not necessarily predominant. Christmas tree plantations, which are considered reserved forest land, are not included.

**Poletimber stand.**—(See Stand-size class.)

**Poletimber tree.**—A tree of commercial species at least 5.0 inches d.b.h. but smaller than sawtimber size.

**Potential productivity class.**—A classification of forest lands in terms of inherent capacity to grow crops of industrial wood. The class

identifies the potential growth in merchantable cubic feet/acre/year at culmination of mean annual increment of fully stocked natural stands.

**Reserved forest land.**—Forest land withdrawn from timber utilization through statute, administrative regulation, designation, or exclusive use for Christmas tree production, as indicated by annual shearing.

**Rotten tree.**—A tree that does not meet regional merchantability standards because of excessive unsound cull. May include noncommercial tree species.

**Rough tree.**—A tree that does not meet regional merchantability standards because of excessive sound cull. May include noncommercial tree species.

**Roundwood products.**—Logs, bolts, or other round sections (including chips from roundwood) cut from trees for industrial or consumer uses. (Note: Includes saw logs, veneer logs, and bolts; cooperage logs and bolts; pulpwood; fuelwood; pilings; poles; posts; hewn ties; mine timbers; and various other round, split, or hewn products.)

**Salvable dead tree.**—A standing or down dead tree considered merchantable by regional standards.

**Sapling.**—A live tree 1.0 to 5.0 inches d.b.h.

**Sapling-seedling stand.**—(See Stand-size class.)

**Saw log.**—A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight and with a minimum diameter outside bark (d.o.b.) for softwoods of 7.0 inches (9.0 inches for hardwoods) or other combinations of size and defect specified by regional standards.

**Saw-log portion.**—That part of the bole of sawtimber trees between the stump and the saw-log top.

**Saw-log top.**—The point on the bole of sawtimber trees above which a saw log cannot be produced. The minimum saw-log top is 7.0 inches d.o.b. for softwoods and 9.0 inches d.o.b. for hardwoods.

**Sawtimber stand.**—(See Stand-size class.)

**Sawtimber tree.**—A tree of commercial species containing at least a 12-foot saw log or two noncontiguous saw logs 8 feet or longer, and meeting regional specifications for freedom from defect. Softwoods must be at least 9.0 inches d.b.h. Hardwoods must be at least 11.0 inches d.b.h.

**Sawtimber volume.**—Net volume of the saw-log portion of live sawtimber in board feet, International 1/4-inch rule (unless specified otherwise) from stump to a minimum 7 inches top diameter outside bark (d.o.b.) for softwoods and a minimum 9 inches top d.o.b. for hardwoods.

**Seedling.**—A live tree less than 1.0 inch d.b.h. that is expected to survive. Only softwood seedlings more than 6 inches tall and hardwood seedlings more than 1 foot tall are counted.

**Short-log (rough tree).**—Sawtimber-size trees of commercial species that contain at least one merchantable 8- to 11-foot saw log but not a 12-foot saw log.

**Shrub.**—A woody, perennial plant differing from a perennial herb in its persistent and woody stem(s), and less definitely from a tree in its lower stature and/or the general absence of a well-defined main stem. For this report, shrubs were separated somewhat arbitrarily into tall and low shrubs as follows:

*Tall shrubs.*—Shrubs normally taller than 1.6 to 3.2 feet (0.5 to 1.0 meters).

*Low shrubs.*—Shrubs normally shorter than 1.6 to 3.2 feet. (Woody perennial vines, such as grape, were included with the low shrubs.)

**Shrub and tree seedling biomass.**—The total aboveground weight of trees less than 1.0 inch in diameter and all shrubs.

**Site index.**—An expression of forest site quality based on the height of a free-growing dominant or codominant tree of a representative species in the forest type at age 50.

**Soft hardwoods.**—Hardwood species with an average specific gravity less than 0.50 such as cottonwood, red maple, basswood, and willow.

**Softwoods.**—Coniferous trees, usually evergreen, having needles or scale-like leaves.

**Stand.**—A group of trees on a minimum of 1 acre of forest land that is stocked by forest trees of any size.

**Stand-age class.**—A classification based on age of the main stand. Main stand refers to trees of the dominant forest type and stand-size class.

**Stand-size class.**—A classification of stocked (see Stocking) forest land based on the size class of live trees on the area; that is, sawtimber, poletimber, or seedlings and saplings.

a. *Sawtimber stands.*—Stands with half or more of live tree stocking in sawtimber or poletimber trees, and with sawtimber stocking at least equal to poletimber stocking.

b. *Poletimber stands.*—Stands with half or more live tree stocking in poletimber and/or sawtimber trees, and with poletimber stocking exceeding that of sawtimber.

c. *Sapling-seedling stands.*—Stands with more than half of the live tree stocking in saplings and/or seedlings.

**State land.**—Land owned by the State of Minnesota or leased to it for 50 years or more.

**Stocking.**—The degree of occupancy of land by live trees, measured by basal area and/or the number of trees in a stand by size or age and spacing, compared to the basal area and/or number of trees required to fully utilize the growth potential of the land; that is, the stocking standard.

A stocking percent of 100 indicates full utilization of the site and is equivalent to 80 square feet of basal area per acre in trees 5.0 inches d.b.h. and larger. In a stand of trees less than 5 inches d.b.h., a stocking percent of 100 would indicate that the present number of trees is sufficient to produce 80 square feet of basal area per acre when the trees reach 5 inches d.b.h.

Stands are grouped into the following stocking classes:

*Overstocked stands.*—Stands in which stocking of live trees is 133 percent or more.

*Fully stocked stands.*—Stands in which stocking of live trees is from 100.0 to 132.9 percent.

*Medium stocked stands.*—Stands in which stocking of live trees is from 60.0 to 99.9 percent.

*Poorly stocked stands.*—Stands in which stocking of live trees is from 16.7 to 59.9 percent.

*Nonstocked areas.*—Timberland on which stocking of live trees is less than 16.7 percent.

**Timber products output.**—All timber products cut from roundwood and byproducts of wood manufacturing plants. Roundwood products include logs, bolts, or other round sections cut from growing-stock trees, cull trees, salvable dead trees, trees on nonforest land, noncommercial species, sapling-size trees, and limbwood. Byproducts from primary manufacturing plants include slabs, edging, trimmings, miscuts, sawdust, shavings, veneer cores and clippings, and screenings of pulpmills that are used as pulpwood chips or other products.

**Timberland.**—Forest land that is producing or capable of producing in excess of 20 cubic feet per acre per year of industrial wood crops under natural conditions, that is not withdrawn from timber utilization, and that is not associated with urban or rural development. Currently inaccessible and inoperable areas are included.

**Tree.**—A woody plant usually having one or more perennial stems, a more or less definitely formed crown of foliage, and a height of at least 12 feet at maturity.

**Tree biomass.**—The total aboveground weight (including the bark but excluding the foliage) of all trees from 1 to 5 inches in d.b.h., and the total aboveground weight (including the bark but excluding the foliage) from a 1-foot stump for trees more than 5 inches in diameter.

**Tree grade.**—A tree classification based on external characteristics as indicators of quality or value, used for hardwood species. (See Appendix for specific grading factors used.)

**Tree size class.**—A classification of trees based on diameter at breast height, including sawtimber trees, poletimber trees, saplings and seedlings.

**Upper stem portion.**—That part of the bole of sawtimber trees above the saw-log top to a minimum top diameter of 4.0 inches outside bark or to the point where the central stem breaks into limbs.

**Urban and other areas.**—Areas within the legal boundaries of cities and towns; suburban areas developed for residential, industrial, or recreational purposes; schoolyards, cemeteries, roads; railroads; airports; beaches; powerlines; and other rights-of-way; or other nonforest land not included in any other specified land use class.

**Urban forest land.**—Land that would otherwise meet the criteria for timberland, but is in an urban-suburban area surrounded by commercial, industrial, or residential development and not likely to be managed for the production of industrial wood products on a continuing basis. Wood removed would be for land clearing, fuelwood, or esthetic purposes. Such forest land may be associated with industrial, commercial, residential subdivision, industrial parks, golf course perimeters, airport buffer strips, and public urban parks that qualify as forest land.

**Water.**—(a) *Bureau of the Census.*—Permanent inland water surfaces, such as lakes, reservoirs, and ponds at least 40 acres in area; and streams, sloughs, estuaries, and canals at least one-eighth of a statute mile wide.

(b) *Noncensus.*—Permanent inland water surfaces, such as lakes, reservoirs, and ponds from 1 to 39.9 acres in area; and streams, sloughs, estuaries, and canals from 120 feet to one-eighth of a statute mile wide.

**Wooded pasture.**—Improved pasture with more than 16.7 percent stocking in live trees, but less than 25 percent stocking in growing-stock trees. Area is currently improved for grazing or there is other evidence of grazing.

**Wooded strip.**—An acre or more of natural continuous forest land that would otherwise meet survey standards for timberland except that it is less than 120 feet wide.

All counties	14,723.2	220.4	2,982.2	5,608.1	3,965.1	1,947.4

<sup>1</sup>This table is based on the stocking percent of growing-stock trees, rather than that of all live trees. For this table, to use the definition of stocking found in the Appendix, replace the term "all live" with "growing-stock."

<sup>2</sup>Area of nonstocked in this table and Table 8 differs from that in other tables in this report because this table includes land stocked with only growing-stock trees, rather than with all alive trees.

<sup>3</sup>Includes: Dodge, Freeborn, Mower, Steele, and Waseca counties.

<sup>4</sup>Includes: McLeod, Nicollet, Renville, and Sibley counties.

<sup>5</sup>Includes: Brown, Cottonwood, Jackson, Martin, Redwood, and Watonwan counties.

<sup>6</sup>Includes: Big Stone, Chippewa, Grant, Lac qui Parle, Lincoln, Lyon, Murray, Nobles, Pipestone, Pope, Rock, Stevens, Swift, Traverse, Wilkin, and Yellow Medicine counties.

<sup>1</sup>This table is based on the stocking percent of growing-stock trees, rather than that of all live trees. For this table, to use the definition of stocking found in the Appendix, replace the term "all live" with "growing-stock."

<sup>2</sup>Area of nonstocked in this table and in Table 6 differs from that in other tables in this report because this table includes land stocked with only growing-stock trees, rather than with all live trees.

Table 9. -- Area of timberland by forest type group/local type and stand-size class,

Paper birch	114,623	-	17,104	49,247	48,272
Black cherry	24,760	-	3,260	16,206	5,294
Black walnut	39,088	-	24,051	6,519	8,518
Butternut	28,088	-	-	7,225	20,863
Other hardwoods	49,624	-	-	24,504	25,120
Total hardwoods	5,807,371	421,380	1,221,690	2,315,858	1,848,443
All species	6,217,059	436,687	1,284,585	2,628,130	1,867,857

\*Two grading systems were used in Minnesota:

Log grades were used for softwoods throughout the State and for hardwoods in the Aspen-Birch and Northern Pine Units. Tree grades were used for hardwoods in the Central Hardwood and Prairie Units.

\*International 1/4-inch rule.

## Prairie Unit

Printed on recycled, recyclable paper.

Our job at the North Central Forest Experiment Station is discovering and creating new knowledge and technology in the field of natural resources and conveying this information to the people who can use it. As a new generation of forests emerges in our region, managers are confronted with two unique challenges: (1) Dealing with the great diversity in composition, quality, and ownership of the forests, and (2) Reconciling the conflicting demands of the people who use them. Helping the forest manager meet these challenges while protecting the environment is what research at North Central is all about.
